KEY TO PRONUNCIATION.

a as in fat, man, pang.
ā as in fate, mane, dale.
ä as in far, father, guard.
â as in fall, talk, naught.
ȧ as in ask, fast, ant.
ã as in fare, hair, bear.

e as in met, pen, bless.
ē as in mete, meet, meat.
ė as in her, fern, heard.

i as in pin, it, biscuit.
ī as in pine, fight, file.

o as in not, on, frog.
ō as in note, poke, floor.
ö as in move, spoon, room.
ô as in nor, song, off.

u as in tub, son, blood.
ū as in mute, acute, few (also new, tube, duty).
ů as in pull, book, could.
ü German ü, French u.

oi as in oil, joint, boy.
ou as in pound, proud, now.

A single dot under a vowel in an unaccented syllable indicates its abbreviation and lightening, without absolute loss of its distinctive quality. Thus:

ạ as in prelate, courage, captain.
ẹ as in ablegate, episcopal.
ọ as in abrogate, eulogy, democrat.
ụ as in singular, education.

A double dot under a vowel in an unaccented syllable indicates that, even in the mouths of the best speakers, its sound is variable to, and in ordinary utterance actually becomes, the short *u*-sound (of but, pun, etc.). Thus:

a̤ as in errant, republican.
e̤ as in prudent, difference.
i̤ as in charity, density.
o̤ as in valor, actor, idiot.

ä̤ as in Persia, peninsula.
ē̤ as in *the* book.
ṳ̄ as in nature, feature.

A mark (⌣) under the consonants *t, d, s, z* indicates that they in like manner are variable to *ch, j, sh, zh*. Thus:

t̰ as in nature, adventure.
d̰ as in arduous, education.
s̰ as in pressure.
z̰ as in seizure.

th as in thin.
ŦH as in then.
ċh as in German ach, Scotch loch.
ṅ French nasalizing n, as in ton, en.
ly (in French words) French liquid (mouillé) l.
′ denotes a primary, ″ a secondary accent. (A secondary accent is not marked if at its regular interval of two syllables from the primary, or from another secondary.)

SIGNS.

< read *from;* i. e., derived from.
> read *whence;* i. e., from which is derived.
\+ read *and;* i. e., compounded with, *or* with suffix.
= read *cognate with;* i. e., etymologically parallel with.
√ read *root.*
* read *theoretical* or *alleged;* i. e., theoretically assumed, or asserted but unverified, form.
† read *obsolete.*
★ refers, in all cases, to material which will be found in the supplementary pages. It is used in the cross-references, and is also placed above (rarely below) the initial letter of a word, when an addition to its definitions will be found in the supplementary pages at the end of one or another of the various volumes.

SPECIAL EXPLANATIONS.

A superior figure placed after a title-word indicates that the word so marked is distinct etymologically from other words, following or preceding it, spelled in the same manner and marked with different numbers. Thus:

back[1] (bak), *n.* The posterior part, etc.
back[1] (bak), *a.* Lying or being behind, etc.
back[1] (bak), *v.* To furnish with a back, etc.
back[1] (bak), *adv.* Behind, etc.
back[2]† (bak), *n.* The earlier form of *bat*[2].
back[3] (bak), *n.* A large flat-bottomed boat, etc.

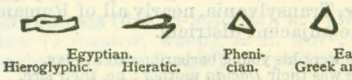
Various abbreviations have been used in the credits to the quotations, as "No." for *number*, "st." for *stanza*, "p." for *page*, "l." for *line*, ¶ for *paragraph*, "fol." for *folio*. The method used in indicating the subdivisions of books will be understood by reference to the following plan:

Section only	§ 5.
Chapter only	xiv.
Canto only	xiv.
Book only	iii.
Book and chapter	iii. 10.
Part and chapter	iii. 10.
Book and line	iii. 10.
Book and page	iii. 10.
Act and scene	iii. 10.
Chapter and verse	iii. 10.
No. and page	iii. 10.
Volume and page	II. 34.
Volume and chapter	IV. iv.
Part, book, and chapter	II. iv. 12.
Part, canto, and stanza	II. iv. 12.
Chapter and section or ¶	vii. § or ¶ 3.
Volume, part, and section or ¶	I. i. § or ¶ 6.
Book, chapter, and section or ¶	I. i. § or ¶ 6.

Different grammatical phases of the same word are grouped under one head, and distinguished by the Roman numerals I., II., III., etc. This applies to transitive and intransitive uses of the same verb, to adjectives used also as nouns, to nouns used also as adjectives, to adverbs used also as prepositions or conjunctions, etc.

The capitalizing and italicizing of certain or all of the words in a synonym-list indicates that the words so distinguished are discriminated in the text immediately following, or under the title referred to.

The figures by which the synonym-lists are sometimes divided indicate the senses or definitions with which they are connected.



The title-words begin with a small (lower-case) letter, or with a capital, according to usage. When usage differs, in this matter, with the different senses of a word, the abbreviations [*cap.*] for "capital" and [*l. c.*] for "lower-case" are used to indicate this variation.

The difference observed in regard to the capitalizing of the second element in zoölogical and botanical terms is in accordance with the existing usage in the two sciences. Thus, in zoölogy, in a scientific name consisting of two words the second of which is derived from a proper name, only the first would be capitalized. But a name of similar derivation in botany would have the second element also capitalized.

The names of zoölogical and botanical classes, orders, families, genera, etc., have been uniformly italicized, in accordance with the present usage of scientific writers.

D

★ **1.** The fourth letter and third consonant in the English alphabet: the corresponding character has the same position and the same value also in the Latin, Greek, and Phenician alphabets, from which it comes to us. (See *A*.) The scheme of corresponding characters (compare the preceding letters) is as follows:

Egyptian. Hieroglyphic. Hieratic. Phenician. Early Greek and Latin.

The sound which the character has from the beginning been used to represent is the sonant or voiced mute (or check, stop, contact sound) corresponding to *t* as surd or breathed, and to *n* as nasal. (See the terms used and the letters referred to.) It is generally called a "dental," but with only a conventional propriety, since the teeth bear no part in its production. It involves a closure of the tip of the tongue against the roof of the mouth at a point near to, or even touching, the upper front teeth (while an intonated or voiced current of air is driven during the closure into the cavity of the mouth, as in the case of the other sonant mutes); it is, then, rather a tongue-tip sound, or a front lingual. Sounds closely akin to it are made with different parts of the front tongue against different parts of the forward palate; hence the *d* is somewhat variously colored in various languages, and in some there are two diverse *d*'s, or even more than two. The *d*, as belonging to the fundamental or Germanic part of our language, has taken the place of a more original aspirate, namely, Sanskrit *dh*, Greek *θ*, Latin oftenest *f*: thus, English *door* = Sanskrit *dhura* = Greek *θύρα* = Latin *fores*. Its regular correspondent in German is *t*: thus, *tor* (usually written *thor*) = English *door*; but, under special conditions, also a *d*: thus, German *ende* = English *end*; German *gold* = English *gold*. The German *d* regularly corresponds to English *th*. (See *th*.) Our *d* has no variety of values; it is, however, not seldom made surd, or pronounced as *t*, as in *picked*, *tipped*, *kissed*, and the like, being in older words of this kind a substitute, for mechanical uniformity of spelling, for earlier *t*; *missed* being formerly *mist*, *miste*, Anglo-Saxon *miste*; *kissed*, formerly *kist*, *kiste*, Anglo-Saxon *cyste*, etc. See $-d^1 = -ed^1$, $-d^2 = -ed^2$.

2. As a numeral, in the Roman system, D stands for 500; when a dash or stroke is placed over it, as $\bar{D}$, it stands for 5,000.—**3.** As a symbol: (*a*) In *music*: (1) The second tone, or *re*, of the scale of C. The ratio between the vibration-numbers of these two tones, when in the relation of *do* and *re*, is $\frac{8}{9}$. The tone above bass C is represented by D, the octave above by d, etc. See *C*, 3. (2) A note which represents this tone. On the treble staff D stands on the first added space below, or on the fourth line (*a*); and on the bass staff it stands on the third line, or on the second added space above (*b*). When other clefs are used, the position of D is different. See *clef*. (3) The key-note of the key of two sharps (*c*). (4) On the keyboard of the organ or pianoforte, the white key or digital included in each group of two black keys. (5) The string in a stringed instrument that is tuned to the tone D, as the third string of the violin, etc. (*b*) In *chem.*, Di is the symbol of *didymium*. (*c*) In *math.*, d is the sign of differentiation, ∂ of partial differentiation, δ of variation, D of derivation (commonly in the sense of taking the differential coefficient), Δ of differencing, and ∇ of the Hamiltonian operator. Many analysts avoid the use of the letter in other senses than these. A letter subjoined to any of these signs of operation shows what is taken as the independent variable, and exponents show the number of times the operations are to be performed. Differentiation (especially when relative to the time) was formerly indicated in England by a dot over the sign of the quantity to be differentiated, this being the notation of Newton's fluxional calculus. (*d*) In the mnemonic words of logic, the sign of reduction to darii.—**4.** As an abbreviation: (*a*) In *Eng. reckoning* (*d.* or d.), an abbreviation of *denarius*, the original name for the English penny: as, £ *s. d.*, pounds, shillings, and pence; 2*s.* 1*d.*, two shillings and one penny. (*b*) Before a date (*d.*), an abbreviation of *died*. (*c*) In dental formulas, an abbreviation of *deciduous*, prefixed without a period to the letters *i*, *c*, and *m*: thus, *di.*, deciduous incisor; *dc.*, deciduous canine; *dm.*, deciduous molar: all being teeth of the milk-dentition of a diphyodont mammal. Thus, the milk- or deciduous dentition of a child is expressed by the formula

$$di.\ \frac{2-2}{2-2},\ dc.\ \frac{1-1}{1-1},\ dm.\ \frac{2-2}{2-2} = \frac{10}{10} = 20;$$

or, more simply, taking one half of each jaw only, *di.* $\frac{2}{2}$, *dc.* $\frac{1}{1}$, *dm.* $\frac{5}{5} \times 2 = 20$. In either case the numbers above the line are those of the upper teeth, and those below the line of the under teeth. See *dental*. (*d*) In *anat.* and *ichth.* (*d.* or *D.*), an abbreviation of *dorsal* (vertebra or fin, respectively). (*e*) In a ship's log-book (*d.*), an abbreviation of *drizzling*.

the color is brownish, sometimes relieved by yellowish spots. The dactyl appears to have been so called because, like a finger, it consists of one long and two short members.] 1. A unit of linear measure; a finger-breadth; a digit: used in reference to Greek, Egyptian, and Babylonian measures. The Egyptian dactyl was precisely one fourth of a palm, and was equal to 0.74 inch, or 18.7 millimeters. The Babylonian and Assyrian dactyls are by some authors considered as the fifth part, by others as the sixth part, of the corresponding palms. The ordinary Greek dactyl was one fourth of a palm, and its value in Athens is variously calculated to be from 1.85 to 1.93 centimeters.

2. In *pros.*, a foot of three syllables, the first long, the second and third short. The dactyl of modern or accentual versification is simply an accented syllable followed by two which are unaccented, and is accounted a dactyl without regard to the relative time taken in pronouncing the several syllables. Thus, the words *cheerily, verily, violate,* and *edify*, which on the principles of ancient metrics would be called respectively a dactyl (– ⏑ ⏑), a tribrach (⏑ ⏑ ⏑), a Cretic (– ⏑ –), and an anapest (⏑ ⏑ –), are all alike regarded as dactyls. The quantitative dactyl of Greek and Latin poetry is tetrasemic — that is, has a magnitude of four moræ (see *mora*); and as two of these constitute the thesis (in the Greek sense) and two the arsis, the dactyl, like its inverse, the anapest (⏑ ⏑ –), belongs to the equal (isorrhythmic) class of feet. The true or normal dactyl has the ictus or metrical stress on the first syllable (– ⏑ ⏑). Its most frequent equivalent or substitute is the dactylic spondee (– –), in which the two short times are contracted into one long. Resolution of the long syllable (– ⏑ ⏑ ⏑) is rare.

If ye vse too many *dactils* together ye make your musike too light and of no solemne grauitie, such as the amorous Elegies in court naturally require.
Puttenham, Arte of Eng. Poesie, p. 106.

The dactylic rhythm in classical poetry was regarded as especially majestic and dignified; a continuous sequence of dactyls, however, produced a relatively lighter and more animated effect, an admixture of spondees giving a more or less heavy or retarded movement to the verse. The most frequent dactylic meter is the hexameter. Other dactylic meters were used in Greek lyric poetry, and in the drama, especially in the earlier period, or in passages expressing lamentation (monodies and commatia). See *hexameter* and *elegiac.*

The classical *dactyliomancy*, of which so curious an account is given in the trial of the conspirators Patricius and Hilarius, who worked it to find out who was to supplant the emperor Valens. A round table was marked at the edge with the letters of the alphabet, and with prayers and mystic ceremonies a ring was held suspended over it by a thread, and by swinging or stopping towards certain letters gave the responsive words of the oracle.

See *shogun*. Though exercising independent authority in their own domains, the daimios acknowledged the mikado as the legitimate ruler of the whole country. During the Tokugawa shogunate (1603–1868) the daimios gradually became subject to the shoguns, who compelled them to live in Yedo, with their families and a certain number of their retainers, for six months of every year, and on their departure for their own provinces to leave their families as hostages. The number of daimios differed at different times, according to the fortunes of war and the caprice of the shoguns. Just before the abolition of the shogunate there were 255, arranged in five classes, with incomes ranging from 10,000 to 1,027,000 koku of rice per annum. In 1871 the daimios surrendered their lands and privileges to the mikado, who granted pensions proportioned to their respective revenues, and relieved them of the support of the samurai, their military retainers. These pensions have since been commuted into active bonds, redeemable by government within thirty years from date of issue. The title has been abolished, and that of *kuwazoku* bestowed upon court and territorial nobles alike. See *kuwazoku*.

Specifically—**7.** To diminish or destroy the oscillation of (a metallic body in motion in a magnetic field). When a conductor is moved in a magnetic field, or when a magnet is moved in the vicinity of a conductor, there will be, in general, an induced current generated which will oppose the motion to which it is due. The moving body will act as if immersed in a viscous liquid, and will more quickly come to rest. Advantage is taken of this fact in stilling the vibrations of a magnetic needle in a galvanometer or a compass by placing masses of conducting metal near the vibrating body. Damping is also accomplished by attaching to the needle a disk, cylinder, or vane, which swings in a liquid or in air.

Some forms of dampers are designed to be controlled by automatic regulators, which are operated either by the heat of the fire directly (by contraction or expansion of a metal) or, when connected with a steam-boiler, by the pressure of the steam. (2) In the pianoforte, a small piece of wood or wire thickly covered with felt, which rests upon the strings belonging to each key of the keyboard. When the key is struck the damper is drawn away from the strings, but the instant the key is released the damper returns and checks the vibrations of the strings. The dampers of all the keys can be raised by pressing the damper-pedal (which see), so that the vibration of the strings can be prolonged after the finger has left the key. (3) The mute of a brass instrument, as a horn. (4) An arrangement for arresting the vibrations of a magnetic needle. See *damp*, *v. t.*, 7. Let others therefore dread and shun the Scriptures for their *darknesse*, I shall wish I may deserve to be reckon'd among those who admire and dwell upon them for their clearnesse. *Milton*, Church-Government, Pref.

The prince of darkness, the devil; Satan. = **Syn.** *Darkness, Obscurity, Dimness, Gloom. Darkness* is the opposite of light, physical or mental, and indicates the complete, or approximately complete, absence of it. *Obscurity* is the state of being overclouded or concealed through the intervention of something which obstructs or shuts out the light, causing objects to be imperfectly illuminated: as, the *obscurity* of a landscape; the style of this author is full of *obscurity*. *Dimness* is indistinctness caused by the intervention of an imperfectly transparent medium, or by imperfection in the eye of the person looking; it is specifically applied to the sight itself: as, *dimness* of vision. *Gloom* is deep shade, approaching absolute darkness, but is now much less often used in that sense, or in the sense of a corresponding darkness of mind, than to express a state of feeling akin to darkness; the lack of ability to see light ahead; deep despondency; lack of hope or joy: as, he lived in constant *gloom*.

But it is one thing to say, *Darwinically*, that every detail observed in an animal's structure is of use to it, or has been of use to its ancestors; and quite another to affirm, teleologically, that every detail of an animal's structure has been created for its benefit. On the former hypothesis, for example, the teeth of the fœtal Balæna have a meaning; on the latter, none. *Huxley*, Lay Sermons, p. 304.

Darwinism (där'win-izm), *n.* [< *Darwin* (see def.) + *-ism.*] **1.** The body of biological doctrine propounded and defended by the English naturalist Charles (Charles Robert) Darwin (1809–1882), especially in his works "The Origin of Species" (1859) and "The Descent of Man" (1871), respecting the origin of species. It is, in general, the theory that all forms of living organisms, including man, have been derived by descent, with modification, from a few primitive forms of life or from one, during the struggle for existence of individual organisms, which results in the survival of those least exposed, by reason of their organization or situation, to destruction. Darwin uses the term 'natural selection' for generalizing this process. It is not to be confounded with the general views of the development or evolution of the visible order of nature which have been entertained by philosophers from the earliest times. (See *evolution*.) That which is specially and properly Darwinian in the general theory of evolution relates to the manner, or methods, or means by which living organisms are developed or evolved from one another: namely, the inherent susceptibility and tendency to diversity; the preservation and perfection of organs best suited to the needs of the individual in its struggle for existence; the perpetuation of the more favorably organized beings, and the destruction of those less fitted to survive, or natural selection; and the fact that, on the whole, each organism resembles its parents more than it resembles anything else in nature. See *selection* and *survival*.

So like, that critics said, and courtiers swore,
A wit it was, and called the phantom More.

=**Syn.** *Dash, Smash, Shatter, Shiver, Crush, Mash.* That which is *dashed* does not necessarily go to pieces: if it is broken, the fact is commonly expressed. That which is *smashed, shattered*, or *shivered* is dashed to pieces suddenly, with violence, at a blow or in a collision. *Smashing* is the roughest and most violent of the three acts; the word expresses the most complete disruption or ruin: as, the drunken soldier *smashed* (*shattered, shivered*) the mirror with the butt of his musket. The use of *smash* or *mash* for *crush* (as, his head was *smashed*, I *mashed* my finger) is colloquial. *Shatter* and *shiver* differ in that *shatter* suggests rather the flying of the parts, and *shiver* the breaking of the substance; and the pieces are more numerous or smaller with *shiver*. That which is *crushed* or *mashed* is broken down under pressure; that which is *mashed* becomes a shapeless mass: sugar and rock are *crushed* into powder, small particles, or bits; apples are *crushed* or *mashed* into pulp in making cider; boiled potatoes are *mashed*, not *crushed*, in preparing them for the table.

They that stand high have many blasts to shake them;

7. (*a*) In *writing* and *printing*, a horizontal stroke or line of varying length, used as a mark of punctuation and for other purposes; specifically, in *printing*, a type the face of which consists of such a line. The dashes regularly furnished in a font of type are called respectively the *em dash* (—, a square of the size of the font), the *en dash* (–, half a square), the *two-em dash* (——, two squares), and the *three-em dash* (———, three squares). In punctuation, the em dash is used to note a sudden transition or break of continuity in a sentence, more marked than that indicated by a comma, and also at the beginning and end of a parenthetical clause—properly of one more directly related to the general sense than a true parenthesis. (See *parenthesis.*) The em or the en dash is often used to indicate the omission of the intermediate terms of a series which are to be supplied in reading, being thus often equivalent to "to . . . , inclusive": thus, Mark iv. 3—20, or 3–20 (that is, verses 3 to 20, inclusive); the years 1880–88 (that is, 1880 to 1888). As a mark of hiatus or suppression, the dash—usually one of the longer ones—stands for something omitted, as a name or part of a name, the concluding words of an unfinished sentence, or the connecting words of a series of broken sentences. Various other more or less arbitrary uses are made of dashes, as in place of *do.* (*ditto*) to indicate repetition of names in a catalogue or the like, as a dividing line between sections, articles, or other portions of matter, etc.

Observe well the *dash* too, at the end of this Name.
Wycherley, Plain Dealer, v. 1.

(*b*) In *printing*, also, a line (variously modified in form) used for the separation of distinct portions of matter, as the parallel dash (═══), the double dash (═══), the diamond or swell dash (—◆—), etc. (*c*) Any short mark or line. —**8.** In *music:* (*a*) The short stroke placed over or under a note by which a staccato effect is indicated. See *staccato*. (*b*) The line or stroke drawn through a figure in thorough-bass which indicates that the tone signified by the figure is to be chromatically raised a semitone. (*c*) In harpsichord-music, a coulé (which see).—**9.** In *zoöl.*, a longitudinal mark, generally rounded and clearly defined at one end, and tapering or gradually becoming indistinct at the other, as if produced by a drop of colored liquid dashed obliquely against the surface, or by the rough stroke of a pen. Such marks are very common on the wings of the *Lepidoptera*.—**10.** A present made by a trader to a chief on the western coast of Africa to secure permission to traffic with the natives.—**11.** Same as *dash-board*.—**12.** In *sporting*, a sprint; any short race up to, but not including, the quarter mile: as, a hundred-yard *dash*.

A full date includes the place, day, month, and year; but in some cases the date may consist of only one or two of these particulars, as the year on a coin. In letters the date is inserted to indicate the time when they are written or sent; in deeds, contracts, wills, and other papers, to indicate the time of execution, and usually the time from which they are to take effect on the rights of the parties; but the written date does not exclude evidence of the real time of execution or delivery, and consequent taking effect. In documents the date is usually placed at the end, but may be at the beginning, as it is now generally in letters.

date-line (dāt'līn), *n.* The boundary-line between neighboring regions where the calendar day is different. This line runs through the Pacific ocean, and is supposed to coincide with the meridian of 12 hours or 180° from Greenwich; but it practically follows a somewhat devious course, and is sometimes confused. Thus the Sundays of the Russian and of the American settlers in Alaska formerly fell upon different days. On the east of the date-line the nominal date is one day earlier than on the west of it; so that the American Sunday in Alaska coincides with the former Russian Monday.

date-mark (dāt'märk), *n.* A special mark stamped on an article of gold or silver to indicate the year of manufacture. Thus, in the London Goldsmiths' Company, during the twenty years from 1856 to 1875 this mark was a letter of the alphabet in small Old English character; for the next twenty years, beginning in 1876 and ending in 1895, Roman capitals were ★adopted.

date-palm (dāt'päm'), *n.* The common name of *Phœnix dactylifera*, the palm-tree of Scripture: also called *date-tree*. Next to the cocoanut-tree, the date is unquestionably the most interesting and useful of the palm tribe. As with the cocoanut-tree, nearly every part is applied to some useful purpose, and the fruit not only affords the principal food of the inhabitants of various countries, but is a source of a large part of their traffic. It is cultivated in immense numbers all over the northern part of Africa as well as in southwestern Asia, and is found through southern Europe, though rarely productive there. Its stem shoots up to the height of from 60 to 80 feet, without branch or division, and is of nearly the same thickness throughout its length. From the summit it throws out a magnificent crown of large feather-shaped leaves, and a number of spadices, each of which in the female plant bears a bunch of from 180 to 200 dates, each bunch weighing from 20 to 25 pounds. The fruit is eaten fresh or dried. The best dates of commerce are obtained from the coasts of the Persian gulf, where the tree is cultivated with great care, and where over 100 varieties are known. The date-palm was probably originally derived from the wild date-palm, *P. sylvestris*, which is found throughout India, and is planted very extensively in Bengal, chiefly for the production of toddy and sugar. See *Phœnix*.

datisi (da-tī'sī), *n.* The mnemonic name given by Petrus Hispanus to that mood of the third figure of syllogism in which the major premise is universal and affirmative, and the minor premise and conclusion are particular and affirmative. These distinctions of quantity and quality are indicated by the vowels of the word, *a-i-i*. The letter *s* after the second vowel shows that the mood is reduced to direct reasoning by the simple conversion of the minor, and the initial *d* shows that the resulting mood is darii. The following is an example of a syllogism in datisi: All men irrationally prejudiced have weak minds; but some men irrationally prejudiced are learned; hence, some learned men have weak minds.

This case is found in all the ancient languages of our family, and is widely preserved even among the later. Though nowhere distinguished in form from the accusative or objective in modern English, it is really present in such expressions as, give *him* his due; show this *man* the way; and *him, whom, them*, and (in part) *her* are historically datives, retaining a dative termination. The precise value of the original Indo-European dative is a matter of doubt and dispute. Abbreviated *dat.*

3. The space of twenty-four hours; specifically, the interval of time which elapses between two consecutive returns of the same terrestrial meridian to the sun. In this latter specific sense it is called the *natural*, *solar*, or *astronomical day*. Since the length of this day is continually varying, owing to the eccentricity of the earth's orbit and the obliquity of the ecliptic, a *mean solar day* (the *civil day*) is employed, which is the average period of one rotation of the earth on its axis relative to the sun's position considered as fixed. The day of twenty-four hours may be reckoned from noon to noon, as in the *astronomical* or *nautical day*, or from midnight to midnight, as in the *civil day* recognized in the United States, throughout the British empire, and in most of the countries of Europe. The Babylonians reckoned the civil day from sunrise to sunrise; the Umbrians, from noon to noon; the Athenians and Hebrews, from sunset to sunset; and the Romans, from midnight to midnight.

A French preposition, found in English only in some French phrases, as *couleur de rose*, or in proper names, as in *Simon de Montfort*, *Cœur de Lion*, *De Vere*, etc., either of Middle English origin, or modern and mere French. Its use in such names, following the name proper, and preceding what was originally, in most cases, the name of an estate, led to its acceptance as evidence of noble or gentle descent, corresponding in this to the German *von* and the Dutch *van*. But as the particle in proper names often originated without any such implication, and has also been often assumed without authority, it is in itself of no value as such evidence.

2. A Latin preposition, meaning 'from' or 'of,' occurring in certain phrases often used in English: as, *de novo*, anew; *de facto*, of fact; *de jure*, of right.

dis-, *dif-*.] 1. A verb-prefix of Latin origin, expressing in Latin, and hence with modifications in modern speech, various phases of the original meaning 'from, away from, down from.' (1) Separative, denoting departure or removal—'off, from off, away, down, out,' or cessation or removal of the fundamental idea: *de-* privative, equivalent to *un-* or *dis-* privative. (2) Completive—'through, out, to the end,' etc. (3) Intensive: a force often lost in English. (See examples following.) In some words the separative or privative force of this prefix is felt in English, as in *decompose*, *demote*, being in such meaning often used as an English prefix (*de-* privative), as in *decentralize*, *de-Saxonize*, *derail*, etc. It is less distinctly felt in words like *depress*, *detract*, etc.; and in many words, where it has in Latin the completive or intensive force, its force is not felt in English, as in *deride*, *denote*, etc.

E. also *deken*; < ME. *deken*, *dekyn*, *decon*, *deacon*, *diacne*, *deakne*, < AS. *deácon*, *diácon* = D. *deken*, *diaken* = MLG. *diaken* = G. *diakon*, *diaconus* = Icel. *djākn*, *djākni*, a deacon, = Dan. *degn*, a parish clerk, = Sw. *djekne*, a scholar (Dan. Sw. *diakonus*, deacon), = OF. *diacne*, *diacre*, F. *diacre* = Pr. *diacre*, *diague* = Sp. *diácono* = Pg. It. *diacono*, < LL. *diaconus* = Goth. *diakaunus*, a deacon, < Gr. διάκονος, a servant, waitingman, messenger, eccles. a deacon; of uncertain origin; perhaps related to διώκειν, pursue, cause to run. The Teut. forms appear to have been in part confused with the forms belonging to L. *decanus*, a dean (see *dean*[2]), and with those belonging with G. *degen*, etc., AS. *thegn*, E. *thane* (see *thane*).] 1. *Eccles.*, one of a body of men, either forming an order of the ministry or serving merely as elected officers of individual churches, whose chief duty is to assist a presbyter, priest, or other clergyman, especially in administering the eucharist and in the care of the poor. (*a*) In the apostolic church, one of an order of ministers or church-officers, inferior to apostles and presbyters, whose duty it was to serve at the Lord's Supper, or agape, and to minister alms to the poor. It is generally believed that the institution of this office is recorded in Acts vi. 1–6, where, although the word *deacon* (διάκονος, minister) is not used of the seven persons appointed, the corresponding words "to minister or serve" (διακονεῖν) and "ministration" (διακονία) are employed. By an analogy with the Mosaic hierarchy, St. Clement of Rome in the apostolic age called the deacons *Levites*, and this use of the word Levite long remained frequent. (*b*) In the early Christian church, one of the third order of the ministry, of lower rank than bishops and presbyters. The deacons applied complete unction to men in preparation for baptism, but anointed women on the forehead only, assisted the celebrant at the eucharist, read the gospel and made proclamations during the liturgy, maintained order in the congregation, and cared for the poor and sick. Those attached to episcopal sees acted as the bishop's adjutants, messengers, and representatives, and when belonging to a great patriarchal or metropolitan see possessed much influence. Hence—(*c*) In the Greek Church, one of the third order of the ministry, similar in rank and duties to the officer of the same name in the early church. (*d*) In the Roman Catholic Church, a member of the third order of the ministry. He assists the priest throughout the celebration of the eucharist or mass, and reads the gospel. The principal assistant to the celebrant at a solemn celebration is called the *deacon*, and vested accordingly, whether in deacon's, priest's, or bishop's orders. (*e*) In the Anglican Church, a member of the third order of the ministry. His duties are to assist the priest in divine service, especially at the holy communion, help in distributing the elements to the people, read the Scriptures, especially the eucharistic gospel, catechize, baptize infants in the absence of the priest, preach if licensed by the bishop, and seek out the sick and poor and make their wants known to the curate. Deacons cannot consecrate the eucharist, pronounce absolution, or give benediction. The bishop, priest, or deacon who acts as principal assistant at the holy communion is called the *deacon* or *gospeler*. (*f*) In the Methodist Episcopal Church, a member of an order of the ministry next below that of elder. The deacons are elected by the annual conference, are ordained by the bishop, and are authorized to assist in the administration of the eucharist, to administer the rites of baptism and marriage, and to perform the duties of a traveling preacher. (*g*) In the Baptist and Congregational churches, one of two or more officers elected by each church to distribute the elements in the communion after they have been consecrated by the minister, and to act as the advisers of the pastor and as the almoners of the charities of the church. (*h*) In the Presbyterian Church, one of a number of officers elected by a congregation and ordained by the minister to assist the session in the care of the poor and in the general management of the secular affairs of the church. Deacons are not always appointed, their place being sometimes supplied by the elders. (*i*) In the Lutheran Church in the United States, one of a number of laymen chosen to attend to the charities and temporalities of a congregation. With an equal number of elders and the pastor, the deacons constitute the council of each church to manage its temporal and spiritual affairs. (*j*) In the Mormon Church, a subordinate official who acts as an assistant to the teacher, but has no authority to baptize or administer the sacrament. *Mormon Catechism*, xvii.

2. In Scotland, the president of an incorporated trade, who is the chairman of its meetings and signs its records. Before the passing of the Burgh Reform Act the deacons of the crafts or incorporated trades in royal burghs formed a constituent part of the town council, and were understood to represent the trades, as distinguished from the merchants and guild brethren. The deacon-convener of the trades in Edinburgh and Glasgow still continues to be a constituent member of the town council.

deacon (dē′kn), *v. t.* [< *deacon*, *n.*] 1. To make or ordain deacon.—2. To read out, as a line of a psalm or hymn, before singing it: sometimes with *off:* from an ancient custom of reading the hymn one or two lines at a time, the congregation singing the lines as read. This office was frequently performed by a deacon. The custom is nearly as old as the Reformation, and was made necessary by the lack of hymn-books when congregational singing was introduced. See *line*, *v. t.*

> A prayer was made, and the chorister *deaconed* the first two lines. *Goodrich*, Reminiscences, I. 77.

3. To arrange so as to present a specious and attractive appearance; present the best and largest specimens (of fruit or vegetables) to view and conceal the defective ones: as, to *deacon* strawberries or apples. [Slang, U. S.] [This sense contains a humorous allusion to the thrifty habits ascribed to the rural New England deacons.] Hence—4. To sophisticate; adulterate; "doctor": as, to *deacon* wine or other liquor. [Slang.]—**Deaconed veal,** veal unfit for use, as when killed too young. [Connecticut.]

deaconess (dē′kn-es), *n.* [Formerly also *deaconisse*; = D. *diakones* = G. *diakoniss-in* = Dan. *diakonisse* = F. *diaconesse*, *diaconisse* = Sp. Pg. *diaconisa* = It. *diaconessa*, < ML. *diaconissa*, fem. of *diaconus*, deacon: see *deacon* and *-ess*.] 1. One of an ecclesiastical order of women in the early church, who discharged for members of their own sex those parts of the diaconal office which could not conveniently or fitly be performed by men. They acted as doorkeepers and kept order on the women's side of the congregation, assisted at the baptism of women and administered the unction before baptism except the anointing of the forehead, instructed female catechumens, took charge of sick and poor women, and were present at interviews of the clergy with women. Such an order was especially needed in those Christian countries where Oriental seclusion of women prevailed. Deaconesses were required to remain unmarried, and were generally selected from the consecrated virgins or from the order of widows. In the Eastern Church the order continued into the middle ages, but it is not certain when it became extinct. In the Western Church it was abolished by successive decrees of councils during the fifth and succeeding centuries, and became finally extinct about the tenth. Abbesses were sometimes called deaconesses after the order became obsolete.

> And Rom. xvi., I commende vnto you Phebe, the *deaconisse* of the church of Cenchris. *Tyndale*, Works, p. 250.

> So Epiphanius: There is an order of *deaconesses* in the church, but not to meddle, or to attempt any of the holy offices. *Jer. Taylor*, Office Ministerial.

2. A member of an order of women more or less fully established in recent times in several Protestant churches, with duties similar to the preceding; also, a member of the Institution of Deaconesses first established by Pastor Fliedner, of the United Evangelical Church of Prussia, at Kaiserswerth in 1836. The latter are wholly devoted, by engagements for fixed periods, to charitable work, as the nursing of the sick, etc. They reside in special houses, which have been established in many parts of the world.

Dumbness is the usual concomitant of complete deafness, but in general results rather from the absence of incitement by the sense of hearing than from any natural defect in the organs of speech. Civil officials so called were known to the Roman law, and are mentioned in the codes of Theodosius and Justinian. The title was thence adopted for Christian use. In the monasteries, for every ten monks a decanus or dean was nominated, who had the charge of their discipline. The senior dean, in the absence of the abbot and provost, governed the monastery; and, since monks had the charge of many cathedral churches, the office of dean was thus introduced into them. Custom gradually determined that there should be only one dean in a cathedral, and he eventually assumed the chief charge of its ecclesiastical and ritual concerns, especially in regard to the choir. He became also general assistant to the bishop. In the Roman Catholic Church, assistants of the bishop, termed *rural deans*, in France in former times often possessed, and in Germany in certain cases still possess, large powers of visitation, administration, and jurisdiction, so that their authority is almost equal to that of bishops. In the Church of England there are, besides the deans of the cathedrals, called *deans of chapters*, whose authority is next that of the bishop, *rural deans*, who are in effect assistants to the bishop, and whose duty it is to visit certain parishes in the diocese, and report on their condition to the bishop. Their functions at one time became almost obsolete, but they have been revived to some extent in recent times. The word is also applied in England to the chief officers of certain peculiar churches or chapels: as, the *dean of the chapels royal*. In the Episcopal Church in America the presiding presbyter of the semi-official body known as a convocation, and of the division of a diocese represented by this body, which division is also called a convocation and is in some respects analogous to the English rural deanery, is called a dean (the dean of convocation).

To save a bishop, may I name a *dean?*
Pope, Epil. to Satires, ii. 33.

2. In universities, originally, the head of a faculty (and most historical writers consider a

dean as essential to the existence of a faculty). The office was at first directly or indirectly elective for one or two years, while commonly filled by the eldest master regent. But the faculties, having in Great Britain and America lost their early more independent corporate existence, are now usually presided over by the head of the university, and the office of dean has sunk to that of a mere registrar or secretary, or has ceased to exist. In English colleges the dean presides in chapel, looks after the moral and religious welfare of the scholars, and is charged with the preservation of discipline. The office is commonly united with one of the tutorships. The office of dean of a college or school is evidently a mere adaptation of that of dean of a monastery, and as such dates from far earlier times than that of dean of a faculty, although the faculties long preceded the colleges.

Certain censors, or *deanes*, appointed to looke to the behaviour and manner of the Students there [at Cambridge]. *Holinshed*, Chronicles.

He long'd at college, only long'd,
All else was well, for she-society. . . .
They lost their weeks; they vext the souls of *deans*.
Tennyson, Princess, Prol.

3. The oldest member in length of service of a constituted body, or a body of persons of equal rank, of whom he is the prescriptive leader in all joint action: as, the *dean* of the diplomatic corps; the *dean* of the French Academy; the *dean* of the Sacred College (the oldest of the cardinals, who possesses high authority by right of his seniority).—**4.** The president for the time being of an incorporation of barristers or law practitioners.—**Dean and chapter**, a bishop's council, consisting of the dean and his prebendaries, whose duties consist in aiding the bishop with their advice in affairs of religion and in the temporal concerns of his see.—**Dean of Arches**, the chief judicial officer of the Archbishop of Canterbury, dean of the Court of Arches, but not really a dean in the modern sense of the word.—**Dean of Faculty**, the president of the Faculty of Advocates in Scotland.—**Dean of gild.** (*a*) The chief officer of a medieval trade-gild, and of some existing gilds in Europe.

They represented that it had been customary to consult, after the city magistracies, only the captains of companies and the *deans of guilds* in matters of government. *Motley*, Dutch Republic, III. 20.

(*b*) In Scotland, the elected head of the merchant company or gildry of a royal burgh, who is a magistrate of the burgh for the supervision of all matters relating to the erection and character of buildings. The office in the full sense now exists only in Edinburgh, Glasgow, Aberdeen, and Perth, its duties in other burghs being performed by an officer bearing the same title, elected by the town council.—**Dean of gild court**, in Scotland, a court presided over by the dean of gild, the jurisdiction of which is confined to the regulation of buildings, to such matters of police as have any connection with buildings, and to the regulation of weights and measures.—**Dean of peculiars.** See *peculiar*.—**Dean of the chapel royal**, a title bestowed on six clergymen of the Church of Scotland, who receive from the crown a portion of the revenues which formerly belonged to the chapel royal in Scotland.—**Dean of the province of Canterbury**, the Bishop of London, to whom, when a convocation is to be assembled, the archbishop sends his mandate for summoning the bishops of the province.

Decapoda (de-kap'ō-dä), *n. pl.* [NL., neut. pl. of *decapus*, having ten feet: see *decapod*.] 1. The ten-footed crustaceans; those *Crustacea* which have five pairs of legs or ambulatory appendages, at least one pair of which is chelate; an order of podophthalmic or stalk-eyed *Crustacea*. See cuts under *Podophthalmia* and *stalk-eyed*. They have the branchiæ inclosed in special lateral thoracic receptacles; a large dorsal carapace or cephalothoracic shield, formed by fusion of the cephalic and thoracic somites, and usually prolonged in front as a beak or rostrum; gnathites or mouth-parts consisting of a pair of mandibles, two pairs of maxillæ, and three pairs of maxillipeds or foot-jaws; and five pairs of ambulatory legs, the first pair of which is usually enlarged, and otherwise modified into great pincer-like claws or chelipeds. The shell is regularly shed, annually or oftener, as long as the animal continues to grow. The order presents two extremes of form, according to the development and construction of the abdominal segments or "tail." In the long-tailed or macrurous *Decapoda*, as the lobster, shrimp, prawn, and crawfish, the abdomen is protruded, jointed, and flexible. In the short-tailed or brachyurous *Decapoda*, as the crabs, it is reduced and folded under the thorax, forming the apron. Various intermediate conditions are also found, as in the hermit-crabs. In consequence, the *Decapoda* are divided into *Macrura* and *Brachyura*, with or without an intermediate group *Anomura*. See these words.

Decimal arithmetic, the ordinary method of arithmetical calculation by the Arabic notation. The term is sometimes restricted to the calculation with decimals.—**Decimal currency.** See *currency.*—**Decimal fraction**, a fraction whose denominator is a power of 10. So long as the quantity is conceived as having a power of 10 for its denominator it is properly and usually called a decimal fraction, however it may be written. The ordinary method of writing it is by prefixing to the numerator (used alone) a dot (the decimal point) with a number of zeros sufficient to make the number of places in the numerator equal to that in the denominator, less one. Thus, $\frac{1}{10}$ = .1, $\frac{1}{100}$ = .01, $\frac{1}{1000}$ = .001, etc.; $2\frac{6}{100}$ = 2.06, etc. See II.—**Decimal measure**, any measure belonging to a decimal system.—**Decimal notation**, a system of writing numbers depending on powers of 10, especially the ordinary system by means of nine digits and a cipher. The system in an imperfect form, wanting the 0 (the places being preserved by ruled columns), is believed to have been invented in India, and is explained in the Latin geometry of Boëthius (died about A. D. 525). The genuineness both of the passage and of the entire work has been much disputed, but is now more usually conceded. The system was, however, entirely disused in Europe until (having been completed by the invention of the 0) it was reintroduced through the Arabians (by whom it is called the *Indian notation*), being first systematically explained in the work of Leonardo da Pisa, about 1200. The extension of the system to fractions was accomplished much later. See II.—**Decimal numeration**, any system of naming numbers by taking them in multiples and powers of 10. Such systems have generally prevailed in all languages, being founded on the use of the ten fingers as helps to count.—**Decimal place**, the position of a figure in decimal notation.—**Decimal point**, a dot separating the whole part from the fractional part of an expression in decimal notation. The decimal point appears to have been first used by Napier (*Constructio*, 1619); the writing of it above the line by Newton. See II.—**Decimal system**, any system of measurement or of counting whose units are powers of 10; especially, the metric system (which see, under *metric*).

II. *n.* An expression denoting a decimal fraction by an extension of the decimal notation. A dot, called the *decimal point*, being placed to the right of the units' place, figures are written to the right of it, the first place in passing to the right being appropriated to tenths, the second to hundredths, etc. Thus, 199320.3 is the same as $199320\frac{3}{10}$; 19932.03 is the same as $19932\frac{3}{100}$; and 1.993203 is the same as $1\frac{993203}{1000000}$. (See *decimal fraction*, above.) The invention of decimals is usually attributed to Stevinus (1582). In his notation a mixed number, for example $1993\frac{203}{1000}$, which is now written 1993-.203, would have been written 1993(0)2(1)0(2)3(3). The decimal point may be placed above the line (a common practice) or on the line.—**Recurring decimal**, a decimal in which after a certain point the digits are continually repeated. If there is but one recurring figure, the expression is called a *repeating decimal;* if there are more than one, the expression is called a *circulating decimal.* But these distinctions are not commonly observed with strictness. A circulating decimal is denoted by means of dots over the first and last figures of the recurring period. Thus, $\frac{1}{74}$ is 0.0135, that is, 0.0135135135, etc.

2. An approximately horizontal platform or floor extending from side to side of a ship or of a part of a ship, as of a deck-house, and supported by beams and carlines. See the supplement.
In wooden ships the deck is formed of planks, spiked to the beams and carlines; in iron ships it is formed of iron plating riveted to the beams and girders and generally covered with wooden planking. An armored deck, or protective deck, is protected by iron or steel plating. The *spar-deck* is the upper deck of those which extend from stem to stern; the *main deck* is the deck immediately below the spar-deck in a double-decked ship; the *quarter-deck* is that part of the spar-deck which is abaft the mainmast; the *topgallant forecastle-deck* is a short deck above the spar-deck in the forward part of the ship, generally extending as far aft as the foremast. In a man-of-war the *berth-deck* is the deck below the gun-deck, where the mess-lockers and -tables are placed, and where the hammocks are slung. The *gun-deck* is the deck of a man-of-war where the battery is carried; in old line-of-battle ships, where guns were carried on three decks below the spar-deck, they were called respectively the upper, middle, and lower gun-deck. A *flush deck* is a spar-deck clear from stem to stern of houses or other encumbrances. The term *half-deck* was formerly applied to the after part of the deck next below the spar-deck, and forward of the cabin bulkhead. The *hurricane-deck* is the upper light deck of side-wheel passenger-steamers. The *orlop-deck* is below the berth-deck, and is where the cables were formerly stowed. The *poop-deck* is the after part of the ship, over the cabin, when the cabin is on the spar-deck. The *turtle-deck* or *turtle-backed deck* is so called from its resemblance to the back of a turtle, and is a convex deck extending a short distance aft from the stem of an ocean steamer to shed the water in a head sea; in many iron steamships of recent model there is a similar arrangement on the stern. In river-steamers in the United

States the *boiler-deck* is the deck on which the boilers are carried. A *cambered deck* is a deck arched so as to be higher in the middle than at the stem or stern — the opposite of the usual practice.

He must increase, but I must *decrease*. John iii. 30.

Decreasing series. See *progression*.=**Syn.** *Decrease*, *Diminish*, *Dwindle*, *Contract*; to lessen, abate, ebb, subside, fall off, fall away, shrink. The first three all mean a becoming less by degrees. *Decrease* more often implies that the causes are imperceptible or not necessarily perceptible, acting, it may be, from within the object itself: as, the swelling *decreases* daily. *Diminish* generally implies the action of some external cause which is more or less in the mind of those concerned: as, his fortune *diminishes* daily through extravagance; the troops *diminish* steadily under disease and conflict. *Decrease* is the appropriate word for reduction of bulk or volume, *diminish* for reduction of number. These distinctions are not always observed. To *dwindle* is to become small in size, amount, or number by slow and imperceptible degrees, the reduction being always undesirable and the result a sort of attenuation: as, the army *dwindled* to a few thousands; the child *dwindled* to a mere skeleton. To *contract* is to become less by shrinkage or a drawing together of parts or elements; it implies loss of size, bulk, or extent, without the loss of constituent substance or parts usually expressed by the other words.

So many wives, who have yet their husbands in their arms; so many parents, who have not the number of their children lessened; so many villages, towns, and cities, whose inhabitants are not *decreased*, their property violated, or their wealth *diminished*, are yet owing to the sober conduct and happy results of your advice.
Dryden, King Arthur, Ded.

If the activities of a living body involve an expenditure not made good by nutrition, *dwindling* follows.

Their decisions were called decrees, and formed part of the imperial constitutions.

5. In *theol.*, one of the eternal purposes of God, whereby for his own glory he has foreordained whatsoever comes to pass. Whether these decrees are absolute or conditional—that is, whether they are according to the counsel of his own will, "without any foresight of faith or good works, or any other thing in the creature, as conditions or causes moving him thereto" (*West. Conf. of Faith*, iii.), or are based upon his foreknowledge of the character and course of his free creatures—is a contested question, the Calvinists taking the former view, the Arminians the latter.

By the *decree* of God for the manifestation of his glory, some men and angels are predestinated unto everlasting life and others foreordained to everlasting death.
West. Conf. of Faith, iii. § 3.

6. deducible (dē-dū′si-bl), *a.* [< *deduce* + *-ible*.] **1†.** Capable of being brought down.

As if . . . God [were] *deducible* to human imbecility.
State Trials, Lt.-Col. Lilburne, an. 1649.

2. Capable of being derived by reasoning from known principles or facts; inferable by deduction.

All properties of a triangle . . . are *deducible* from the complex idea of three lines including a space. *Locke.*

Gnotho. Do not *deduct* it to days, t'will be the more tedious; and to measure it by hourglasses were intolerable. *Middleton, Massinger, and Rowley*, Old Law, iii. 1.

4. To take away, separate, or remove in numbering, estimating, or calculating; subtract, as a counterbalancing item or particular: as, to *deduct* losses from the total receipts; from the amount of profits *deduct* the freight-charges.

The late king had also agreed that two and a half per cent should be *deducted* out of the pay of the foreign troops. *Bp. Burnet*, Hist. Own Times, an. 1711.

=**Syn. 4.** *Deduct*, *Subtract*. These words cannot properly be used interchangeably. *Deduct* is to lead away, set aside, in a general or distributive sense; *subtract*, to draw off, remove, in a literal or collective sense. In settling a mercantile account, certain items, as charges, losses, etc., are *deducted* by being added together and their total *subtracted* from the grand total of the transaction. From a parcel of goods of known value or number articles are *subtracted* or literally taken away as required; the value or number of the remainder at any time may be ascertained by *deducting* the value or number of those taken from the original package; and this again is effected by *subtracting* the figures representing the smaller amount from those representing the larger.

deductible (dē-duk′ti-bl), *a.* [< *deduct* + *-ible*.] **1.** Capable of being deducted or withdrawn.—**2†.** Deducible.

deductio (dē-duk′shi-ō), *n.* [L.: see *deduction*.] Deduction; specifically, in *music*, the regular succession of notes in the hexachords of the musical system introduced by Guido d'Arezzo, about A. 2†. The act of deriving; derivation.

To them [vowels], as is well known to etymologists, little regard is to be shewn in the *deduction* of one language from another. *Johnson*, Eng. Dict., Pref.

3. In *logic*, derivation as a result from a known principle; necessary inference; also, the result itself, as so concluded. As a term of logic, it is a translation of Aristotle's ἀπαγωγή (translated *deductio* by Boëthius), and properly signifies an illative descent from a general principle to the result of that principle in a special case; it is specially used by Aristotle when there is a doubt whether the case truly comes under the principle. By the older logicians it is little used, and not with any exact signification. In modern times it has been chiefly employed by those who hold that all reasoning is either a descent from generals to particulars (*deduction*) or an ascent from particulars to generals (*induction*). See *deductive reasoning*, under *deductive*.

Probation may be either a process of *deduction*—that is, the leading of proof out of one higher or more general proposition—or a process of induction—that is, the leading of proof out of a plurality of lower or less general judgments. *Sir W. Hamilton.*

Deduction . . . is the inverse process of inferring a particular case from a law of cases assumed to be of like nature.
G. H. Lewes, Probs. of Life and Mind, 1st ser., III. iv. § 47.

It is astonishing how little of the real life of the time we learn from the Troubadours except by way of inference and *deduction*. *Lowell*, Study Windows, p. 236.

4. The act of deducting or taking away; subtraction; abatement: as, the *deduction* of the subtrahend from the minuend; prompt payment will insure a large *deduction*.—**5†.** A payment; a statement of payments.

The other Curate, of Luddyngton, payde by the Warden, as apperythe aboue in the *deduccouions* of the same College. *English Gilds* (E. E. T. S.), p. 222.

Deduction for new, in *mercantile law*, the allowance, usually one third, made to one who is required to reimburse or to advance the cost of repairing a damage to a vessel caused by the perils of navigation, the presumption being that the renewed part is better than the old.—**Deduction of a claim,** in *law*, the proof of a right by showing that it results from principles of law or equity.—**Deduction of a concept,** in *Kantian philos.*, the proof that the concept has a meaning—that is, refers to an object.—**Transcendental deduction,** in *Kantian metaph.*, the proof of the objective validity of any concept.=**Syn. 3.** *Conclusion*, *Corollary*, etc. See *inference*.—**4.** Subtraction, diminution, discount, tare.

deductive (dē-duk′tiv), *a.* [= F. *déductif* = Sp. Pg. *deductivo*, < LL. *deductivus*, < L. *deducere*, deduce, deduct: see *deduce* and *deduct*.] **1.** Consisting of deduction; of the nature of or based on inference from accepted principles.

We ought therefore to be fully aware of the modes and degree in which the forms of *deductive* reasoning are affected by the theory of probability, and many persons might be surprised at the results which must be admitted.
Jevons.

Before *deductive* interpretation of the general truths, there must be some inductive establishment of them.
H. Spencer, Prin. of Sociol., § 211.

2. Deduced; derived as a conclusion from accepted principles; relating to inference from a principle to the results of that principle in any special case.

He labours to introduce a secondary and *deductive* Atheism: that although men concede there is a God, yet they should deny his providence.
Sir T. Browne, Vulg. Err., i. 10.

Deductive method, in the logical system of J. S. Mill, that mode of investigation by which the law of an effect is ascertained from the consideration of the laws of the different tendencies of which it is the joint result. This method consists of three kinds of operation, the first direct induction, the second ratiocination, the third verification.

To the *deductive method*, thus characterized in its three constituent parts of induction, ratiocination, and verification, the human mind is indebted for its most conspicuous triumphs in the investigation of nature.
Mill, Logic, III. xi. § 6.

Deductive reasoning is commonly opposed to *inductive*, and is meant to include all necessary reasoning (even mathematical induction), together with those probable reasonings which predict results as true in the long run, but excluding those inferences which are regarded as being open to correction in the long run. Thus, if, from counting the letters on a single page, one concludes the proportions of the different letters which will generally be needed in a font of type, the reasoning is *inductive*; but if, knowing what the proportions generally are, one concludes what will be needed in printing a particular book or page, the reasoning is *deductive*.

deductively (dē-duk′tiv-li), *adv.* By deduction; in consequence of a general principle.

There is scarce a popular errour passant in our days, which is not either directly expressed or *deductively* contained in this work [Pliny's Natural History].

This result has been attained by a combination of improvements displaying great ingenuity, in which the inventive genius of Sir William Thomson (Lord Kelvin) has been particularly conspicuous. The principal features of the most perfect sounding-machine are: (1) the sinker, which is a cannon-ball, through which passes a cylinder provided with a valve to collect and retain a specimen of the bottom, the cylinder being, by an ingenious mechanical arrangement, detached from the shot, which remains at the bottom; (2) the line, made of steel wire, weighing about 14½ pounds to the nautical mile; (3) machinery for regulating the lowering of the sinker and for reeling in the wire with the cylinder attached in such a manner that the irregular strain due to the motion of the ship may be guarded against and the danger of breakage thus reduced to a minimum. In the deepest accurate sounding yet made the bottom was reached at the depth of 5,269 fathoms. This sounding was made on the United States steamship "Nero" in the vicinity of the island of Guam. The deepest sounding previously made in which a specimen of the bottom was brought up was that of the United States Coast Survey steamer "Blake," off Porto Rico, the depth there reached being 4,561 fathoms.

Origin uncertain; perhaps orig. an adj., meaning 'wild,' identical with AS. *deór*, bold, brave, vehement, OHG. *tiorlih*, wild. (The AS. *deór*, bold, brave, vehement, was merged later with *deóre*, E. *dear:* see *dear*.) Not connected with Gr. *θήρ*, Æolic *φήρ*, a wild beast, or with L. *fērus*, wild, fem. *fēra* (sc. *bestia*), a wild beast (whence ult. E. *fierce*, *ferocious*). The restricted (but not exclusive) use of the word (for *Cervus*) appears in ME., Icel., Sw., Dan., and G. (in hunters' language), and now prevails in mod. E. It is due to the importance of this animal in the chase. Similarly, in Iceland, *dȳr* is applied esp. to the fox, as the only beast of prey. =Syn. 5. *Beat, Overpower, Overwhelm, Defeat, Discomfit, Rout, Overthrow*, conquer. *Beat* is a general, somewhat indefinite, but vigorous word, covering the others. *Overpower* and *overwhelm* are the least discreditable to the one that loses in the struggle; *overpower* is least permanent in its effects. To *overpower* is to overcome by superiority of strength or numbers, but the disadvantage may be changed by the arrival of reinforcements. To *overwhelm* is to bear down utterly, to sweep clear away by superior strength. *Defeat* is to overcome or get the better of in some kind of contest, and implies less discredit, but generally greater disaster, to the defeated party than *beat*: as, that army is considered *beaten* which withdraws from the field. *Defeat* implies a serious disadvantage, because it applies more often to large numbers engaged. *Discomfit* has fallen into comparative disuse, except in its secondary sense of foiling, etc.; in that it expresses a comparatively complete and mortifying defeat. *Rout* is to defeat and drive off the field in confusion. *Overthrow* is the most decisive and final of these words; it naturally applies only to great persons, concerns, armies, etc. See *conquer*.

There's a lean fellow *beats* all conquerors.

3. A statement of the signification of a word or phrase, or of what is essential to the conception of any given thing; an explanation of how any given kind is distinguished from all other kinds.

Three conceptions of the nature of definition have prevailed at different times: (1) Aristotle taught that every strict definition consists of two parts, different in kind, one declaring the genus or higher class to which the species defined belongs, the other declaring the specific difference by which the given species differs from others of the same genus. This view influences most of the definitions of systematic botany and zoölogy. (2) The theory of logical extension and comprehension, coming into vogue on the overthrow of Aristotelianism and attaining its extreme development in the formal logic of Kant and his followers, made the definition a mere list of essential marks all standing upon one footing and aggregated together without any distinction between genus and difference. This, being an extremely nominalistic view, answers very well for the definitions of some artificial classes in mathematics, etc. (3) Modern logicians, recognizing that the elements of a definition are neither, in general, merely joined together without order nor always combined on one fixed model, conceive the definition to be an explanation of the construction of the concept to be defined out of others better known. According to the two first views alike, some concepts are indefinable because so abstract that no wider ones embracing them can be found; according to the third, no concept can be too abstract to admit of definition, the only indefinable ideas being such as the sensation of redness, the sense of fear, and the like, which direct experience alone can impart. An example of definitions conforming to the third conception is: "An *uncle* is the son of a parent of a parent"—a definition in which the notions of *son* and *parent* neither stand in the relation of genus and difference nor are merely aggregated together. Such also is the definition "*Substance* is the permanent element in the phenomenon."

Though *definitions* will serve to explain the names of substances as they stand for our ideas, yet they leave them not without great imperfection as they stand for things.
Locke, Human Understanding, III. xi. 24.

The hypothesis of *Degeneration* will, I believe, be found to render most valuable service in pointing out the true relationships of animals which are a puzzle and a mystery when we use only and exclusively the hypothesis of Balance, or the hypothesis of Elaboration.
E. R. Lankester, Degeneration, p. 30.

And now to inquire briefly what is meant by *degeneration*. It means literally an unkinding, the undoing of a kind, and in this sense was first used to express the change of kind without regard to whether the change was to perfect or to degrade; but it is now used exclusively to denote a change from a higher to a lower kind: that is to say, from a more complex to a less complex organisation; it is a process of dissolution, the opposite of that process of involution which is pre-essential to evolution.
Maudsley, Body and Will, p. 240.

Specifically—**2.** Loss or impairment of natural or proper qualities; descent to an inferior state; the act of becoming or the state of having become inferior, especially with respect to moral qualities.—**3.** In *physiol.*, any process by which a tissue or substance becomes replaced by some other regarded as less highly organized, less complex in composition, of inferior physiological rank, or less suited for the performance of its original functions. *Quain*, Med. Dict., p. 334.

Degeneration may be defined as a gradual change of the structure in which the organism becomes adapted to less varied and less complex conditions of life.
E. R. Lankester, Degeneration, p. 32.

4. A degenerate animal or plant; an organism of a degraded type. [Rare.]

The theory makes the degeneration chiefly the result of disuse of parts: thus, the cetaceans are descendants from quadrupeds, and have assumed the fish-like form and lost their hind limbs in better accommodating themselves to aquatic life; the small-winged and flightless birds are descendants from those with well-developed wings, which, on account of residence in places where they were not much disturbed, have failed to exercise their wings, and finally lost the use of them, and they have aborted; the intestinal worms without an intestine are descendants from those with an intestine, but on account of their environments the skin has assumed the function of a nutrient medium and the intestine has been lost.—**Lardaceous degeneration.** Same as *lardaceous disease* (which see, under *lardaceous*).—**Mucoid degeneration,** the conversion of cells or intercellular substance into a semifluid translucent substance containing mucin.—**Parenchymatous degeneration.** Same as *cloudy swelling* (which see, under *cloudy*).—**Pigmentary degeneration,** disturbance of the nutrition of a part, with deposition of pigment.—**Wallerian degeneration,** the degeneration of nerve-fibers which have been separated, as by section of a nerve, from certain ganglia which exercise a nutritive influence on them.

Sw. *degradation*, < ML. *degradatio(n-)*, a reducing in rank, < *degradare*: see *degrade*.] **1.** A reducing in rank; the act of depriving one of a degree of honor, of dignity, or of rank; deposition, removal, or dismissal from rank or office: as, the *degradation* of a general. Specifically—(*a*) In *eccles. law*, the act of depriving an ecclesiastic of his orders or privileges, or of both. The Roman Catholic Church recognizes two methods of degradation. By the *simple* or *verbal degradation* the accused is deprived of all his orders and benefices. By the *solemn* or *real degradation* he is with great ceremony stripped of his ecclesiastical vestments and ornaments and publicly reproached by the bishop, deprived of his orders and benefices as in simple degradation, and of his various privileges. He remains, however, a priest, and can in special emergencies consecrate and administer the sacraments. Degradation is now resorted to only in extreme cases. In the early church the culprit was degraded by removal from a higher to a lower grade of office. See *deprivation*, 4. (*b*) The act of depriving a person of his degree in a university. (*c*) In early American colleges, when the students' names were arranged according to the social rank of the parents, the placing of a name, as a punishment, lower than it would otherwise be placed. *B. 7. In *biol.*, abortive structural development; retrograde metamorphosis, such as that witnessed in many parasites as a result of their parasitism.

The *degradation* of the species man is observed in some of its varieties. *Dana.*

The course of development may, in particular cases, lead to numerous retrogressions, so that we may find the adult animal to be of lower organization than the larva. This phenomenon, which is known as retrogressive metamorphosis, corresponds to the demands of the selection

theory, since under more simple conditions of life, where nourishment is more easily obtained (parasitism), *degradation* and even the loss of parts may be of advantage to the organism. *Claus*, Zoölogy (trans.), I. 158.

8. In *bot.*, a change consisting of abstraction, loss, abortion, or non-development of usual organs.—**9.** In *her.*, same as *abatement*.—**Degradation of energy.** See *energy*.—**Syn. 1** and **2.** Debasement, abasement, vitiation, depression, disgrace, dishonor, humiliation.

4. In *biol.*: (*a*) To reduce in taxonomic rank; lower in the scale of classification: as, to *degrade* an order to the rank of a family. (*b*) To reduce in complexity of structure or function; simplify morphologically or physiologically: as, an organism *degraded* by parasitic habit.

The degree to which many of the most important organs in these *degraded* [cleistogamic] flowers have been reduced, or even wholly obliterated, is one of their most remarkable peculiarities, reminding us of many parasitic animals. *Darwin*, Different Forms of Flowers, p. 336.

5. In universities and colleges, an academical rank conferred by a diploma, originally giving the right to teach. The earliest degree was that of *master*, which in the university of Bologna, and others modeled on that (as were the faculties of law in all the old universities), was called the degree of *doctor*. Afterward the lower degree of *determinant* (later called *bachelor*) was introduced, and the intermediate degree of *licentiate*; but these were not regular degrees, except in the faculty of arts. The degree of bachelor was conferred by the "nation" of the faculty of arts; the others were given by the chancellor, by authority of the pope. Thus, the medieval degrees were: (1) the degree of determinant, or bachelor of arts, without a diploma; (2) the license; (3) the degree of master of arts; (4) the degree of master or doctor of theology; (5) the degree of master or doctor of medicine; (6) the degree of doctor of laws. The degrees now usually conferred are bachelor, master, and doctor: as, bachelor of arts, divinity, music, or law; master of arts; doctor of divinity, law, medicine, philosophy, music, etc.

He [Wolsey] was born at Ipswich in Suffolk, the Son of a Butcher, sent to Oxford by Reason of his Pregnancy of Wit, so soon, that taking there the first *Degree* of Art, he was called the Boy Batchelor. *Baker*, Chronicles, p. 261.

The Universities ceased to teach the systematic theology of the Schools, and the systematic jurisprudence of the Decretals; and the ancient *degrees* of bachelor and doctor of the canon law are known, except during the reign of Mary, no more.
Stubbs, Medieval and Modern Hist., p. 319.

6. In *geneal.*, a certain distance or remove in the line of descent, determining the proximity of blood: as, a relation in the third or fourth *degree*. See first extract, and *forbidden degrees*, below.

In the canon law, *degree* of relationship is reckoned by the number of steps from the person farthest from the common ancestor to him; in the civil law, by the number of steps from one person up to the common ancestor and down to the other. Thus, a grand-uncle is related to his grand-nephew in the third *degree* by the canon law, in the fourth *degree* by the civil. *Stimson.*

She was as familiar as a cousin; but as a distant one—a cousin who had been brought up to observe *degrees*.
H. James, Jr., Harper's Mag., LXXVI. 342.

7. In *alg.*, the rank of an equation, as determined by the highest power under which an unknown quantity appears in it. Thus, if the exponent of the highest power of the unknown quantity be 3 or 4, the equation is of the third or fourth *degree*.

8. One of a number of subdivisions of something extended in space or time. Specifically—(*a*) One of a number of equal subdivisions on the scale of a meteorological or other instrument, as a thermometer. (*b*) A unit for measuring circular arcs and the angles subtended by them at their centers, being the 360th part of a circumference, or the 90th part of a right angle. Considered as angular magnitudes, all degrees are equal; considered as lengths of arcs, they are directly proportional to the radii of the circles of which they are parts. This manner of dividing the circle originated with the Babylonians about 2000 B. C., and was brought into use in Greece by the mathematician Hypsicles. It was perhaps in its origin connected with an opinion that the year consisted of 360 days. The common abbreviation or sign for "degrees" is a small circle (°) placed to the right of the top of the last figure of the number of them: as, 45°. The degree is subdivided into 60 minutes, and the minute into 60 seconds. The length of a degree of latitude is the length of an arc of the section of the figure of the sea-level by a meridian, the difference of latitude between the extremities of this arc being one degree. (See *latitude*.) It is 68.702 statute miles at the equator, and 69.396 at the poles. The length of a degree of longitude is the length of an arc of the section of the figure of the sea-level by a plane parallel to the equator, the difference of longitude between the extremities of this arc being one degree. This is nearly proportional to the cosine of the latitude, and is equal to 69.16 statute miles at the equator.

Mandeville, Travels, p. 185.

(*c*) In *arith.*, three figures taken together in numeration: thus, the number 270,360 consists of two *degrees* (more commonly called *periods*). (*d*) In *music*: (1) One of the lines or spaces of the staff, upon which notes are placed. Notes on the same degree, when affected by accidentals, may denote different tones, as D, D♯, and D♭; and, similarly, notes on different degrees, as D♭ and C♯, may denote identical tones, at least upon instruments of fixed intonation. (2) The difference or step between a line and the adjacent space on the staff (or vice versa). Occasionally, through the use of accidentals, this difference is only apparent (see above). (3) The difference, interval, or step between any tone of the scale and the tone next above or below it, as from *do* to *re*, from *mi* to *fa*. Chronic degree, one 360th part of a tropical year.—**Conjunct degrees.** See *conjunct.*—**Degree cut.** See *cut.*—**Degree of a curve**, the same as its *order*, but the latter term is preferable.—**Degree of constraint.** See *constraint.*—**Degree of freedom.** See *freedom.*—**Discrete degrees.** See *discrete.*—**Forbidden or prohibited degrees**, in *civil* and in *canon law*, degrees of consanguinity and affinity within which marriage is not allowed. The determination of these in church or canon law was founded on the prohibitions contained in Lev. xviii., with adherence to the principle that a degree of relationship which bars marriage in one sex bars it equally in the other, and that by Christ's declaration (Mat. xix. 6 and Mark x. 8, confirming Gen. ii. 24) a man and his wife become one flesh. The Roman law prohibited nearly the same degrees, though marriage of a man with his niece was permitted from the time of Claudius until forbidden by Nerva, and also from the time of Caracalla to that of Constantine. Marriages with a deceased brother's wife and a deceased wife's sister were forbidden by Constantius. Theodosius the Great forbade them between first cousins, and this was the general rule of the church from that time on. From the sixth to the thirteenth century, marriages within the seventh degree were prohibited; after the fourth Lateran Council (A. D. 1215), only those within the fourth degree. Marriage between godparents and godchildren was prohibited by Justinian, and this was afterward extended to include the parents of the children, and later still other relations of these. The presenter for confirmation was put on a par with the godparents. The Council of Trent limited such spiritual relationship to sponsors, to presenters at confirmation, to the persons baptized or confirmed, and the parents of these. In England marriage between first cousins was forbidden till the Reformation. The present English law of both church and state is conformed to a statute passed under Henry VIII., and revised under Elizabeth, which forbids all marriages not without the Levitical degrees. These degrees were tabulated by Archbishop Parker in 1563, and his table is adopted in the 99th canon of 1603, and ordered to be set up publicly in every church. It will also be found printed at the end of every English prayer-book. Its provisions have been summarized as follows: A man may not marry the mother or stepmother of his own or his wife's parents; the widow of his father, father-in-law, uncle, brother, son, stepson, or nephew; the aunt, sister, daughter, or niece of himself or his wife; the daughter or stepdaughter of his own or his wife's children. A woman may not marry the father or stepfather of her own or her husband's parents; the widower of her mother, mother-in-law, aunt, sister, daughter, stepdaughter, or niece; the uncle, brother, son, or nephew of herself or her husband; the son or stepson of her own or her husband's children. Marriage with a deceased wife's sister, whether expressly forbidden by the Mosaic law or not, is prohibited as precisely analogous to that with a deceased husband's brother, the marriage of a man with his brother's wife being explicitly prohibited in Lev. xviii. Direct relationship, if in the ascending and descending line, is canonically reckoned as one degree, and marriage prohibited accordingly. In canon law an illicit connection is held to involve the same prohibitions as a marriage.—**In degree†**, greatly; to a degree.

He was greved *in degre*,

York Plays, p. 53.

In size and shape the *Delphinidæ* vary greatly. With few exceptions they are marine. As above described, the family includes all the marine cetaceans known as dolphins, porpoises, grampuses, etc., as well as the caaing- or pilot-whales, belugas or white whales, and the narwhal. The flowers are in loose racemes, and are very irregular, consisting of five colored sepals and only two conspicuous petals, the spurs of which are inclosed in the long spur of the upper sepal. There are 120 species or more, scattered over the north temperate zone, a fourth of which are found in the United States. Two species peculiar to California have red or yellowish flowers. Many are cultivated in gardens under the name of larkspur, chiefly *D. Ajacis* and *D. Consolida* of Europe, and *D. elatum* from Siberia, with numerous hybrids. One species, the *D. Delphinus (del-fī'nus), *n.* [L., a dolphin: see *delphin*[1] and *dolphin*.] 1. The typical genus of the family *Delphinidæ*, to which very different limits have been assigned. (*a*) By the authors of the Linnean school it was used for all the cetaceans with teeth in both jaws, and consequently for the *Delphinidæ* (except *Monodon*), *Platanistidæ*, and *Iniidæ*. (*b*) By later authors it was restricted to *Delphinidæ*, but included at first all except those of the genera *Phocæna* and *Delphinapterus;* gradually others were excluded. (*c*) By recent authors it is restricted to species of *Delphininæ* whose chief peculiarity is in the deep longitudinal grooves on the sides of the palate, separating the alveolar border from the median ridge. They have numerous (more than 80) small pointed teeth, close set along each jaw; from 50 to 90 vertebræ; the rostral part of the skull longer than the cranial portion, whence the head has a pointed snout marked off from the forehead by a groove; the dorsal fin large, triangular or falcate, sometimes wanting; and the flippers of moderate size, narrow, pointed, and falcate, with the lateral digits small or rudimentary. As thus defined, the genus contains the animals to which the word *dolphin* should be restricted, as the original dolphin of the ancients, *Delphinus delphis*, but which are commonly called *porpoises* by confounding them with the species of *Phocæna*, sometimes called *bottle-nosed* or *bay porpoises*. The tursio, *D. tursio*, is a larger and bulkier species. Sundry dolphins marked with white, and having from 80 to 90 vertebræ, constitute a group to which the name *Lagenorhynchus* is applied. A Chinese species, with only about 50 vertebræ, is called *Steno sinensis*. A species from the south seas, *D. peroni*, without a dorsal fin, has been called *Leucorhamphus* and *Delphinapterus*. See cut under *dolphin*.

Delta-metal is said to be as strong as mild steel, and to have the great advantage of not rusting. A small steamer has been constructed of this alloy for navigating the rivers of Central Africa. It is said, also, that it has been introduced as a material for rolls in powder-mills because not liable to give rise to sparks as steel rollers do, and that it is coming into use for many other purposes where strength is desired, and where the facility with which steel rusts makes its employment undesirable.

E. A. Freeman, Amer. Lects., p. 383.

=**Syn. 2.** *Illusion, Delusion, Hallucination.* As now technically used, especially by the best authorities in medical jurisprudence, *illusion* signifies a false mental appearance or conception produced by an external cause acting through the senses, the falsity of which is capable of detection by the subject of it by examination or reasoning. Thus, a mirage, or the momentary belief that a reflection in a mirror is a real object, is an *illusion*. A *delusion* is a fixed false mental conception, occasioned by an external object acting upon the senses, but not capable of correction or removal by examination or reasoning. Thus, a fixed belief that an inanimate object is a living person, that all one's friends are conspiring against one, that all food offered is poisoned, and the like, are *delusions*. A *hallucination* is a false conception occasioned by internal condition without external cause or aid of the senses, such as imagining that one hears an external voice when there is no sound to suggest such an idea. If a person walking at twilight, seeing a post, should believe it to be a spy pursuing him, and should imagine he saw it move, this would be an *illusion;* a continuous belief that every person one sees is a spy pursuing one, if such as cannot be removed by evidence, is a *delusion;* a belief that one sees such spies pursuing, when there is no object in sight capable of suggesting such a thought, is a *hallucination*. *Illusions* are not necessarily indications of insanity; *delusions* and *hallucinations*, if fixed, are. In literary and popular use an *illusion* is an unreal appearance presented in any way to the bodily or the mental vision; it is often pleasing, harmless, or even useful. The word *delusion* expresses strongly the mental condition of the person who puts too great faith in an illusion or any other error: he "labors under a *delusion*." A *delusion* is a mental error or deception, and may have regard to things actually existing, as well as to illusions. *Delusions* are ordinarily repulsive and discreditable, and may even be mischievous. We speak of the *illusions* of fancy, hope, youth, and the like, but of the *delusions* of a fanatic or a lunatic. A *hallucination* is the product of an imagination disordered, perhaps beyond the bounds of sanity; a flighty or crazy notion or belief, generally of some degree of permanence; a special aberration of belief as to some specific point: the central suggestion in the word is that of the groundlessness of the belief or opinion.

Poetry produces an *illusion* on the eye of the mind, as a magic lantern produces an *illusion* on the eye of the body. *Macaulay*, Milton.

Dreams or *illusions*, call them what you will,

4. A public exhibition, by a number of persons, of sympathy with some political or other cause, as in a mass-meeting or a procession.—**5.** Proof, either (*a*) a process of stating in an orderly manner indubitable propositions which evidently cannot be true without the truth of the conclusion so proved, or (*b*) the propositions so stated. Properly, demonstration is restricted to perfect proof, especially mathematical proof. (See the extract from Burgersdicius, below.) According to the Aristotelian doctrine, which has greatly influenced the use of the word, *demonstration* must be drawn from principles not only self-evident, but also underived from any higher principles; and the conclusion must not only be shown to be true, but also to be a mere special case of the truth of one or more of the principles from which it is derived. It was supposed that this was the character of the best mathematical proofs; but mathematical proof consists in constructing a diagram or formula according to certain rules which prescribe that certain relations shall exist between the parts of that diagram, and then in showing by observation (directly or indirectly) that certain additional relations exist between those parts; and no important mathematical proof is of the nature of the Aristotelian demonstration. The word has consequently acquired two significations: first, its original sense of a perfect mathematical proof; second, the sense of a proof drawn from principles, as in the Aristotelian theory. There is also a third signification, according to which a *demonstration* is any proof which leaves no room for reasonable doubt, such as Kepler's proof that the orbit of Mars is an ellipse. Writers who adopt the Aristotelian view hold that the *reductio ad absurdum* and the Fermatian mode of proof, though entirely convincing, are not perfect demonstrations.

Some an admirable delight drew to Musicke; and some, the certainty of *demonstration* to the Mathematickes.
Sir P. Sidney, Apol. for Poetrie.

Demonstration is a syllogism made of such propositions as are true, first immediate, and manifestly known, and be the causes of the conclusion. First and immediate here is all one, signifying such propositions as need not be proved or made more evident by any other former propositions. *Blundeville.*

Demonstration, in the Greek ἀποδείξις, is amongst the geometricians a delineation of a diagram, in which they exhibit the truth of their propositions to be seen by the eye. To that is opposed pseudographema: that is, a description or false delineation. Now these words, as many others, which are used in the doctrine of syllogism, are translated from geometry into logic; and there *demonstration* is taken sometimes for any certain and perspicuous proof, but here in this place strictly for syllogism scientific, and pseudographema, or false syllogism, for syllogism begetting error or contrary to science.
Burgersdicius, tr. by a Gentleman.

densimeter (den-sim′e-tėr), *n.* [= Sp. *densímetro*, < L. *densus*, dense, + *metrum*, a measure.] An apparatus for ascertaining the specific gravity or comparative density of a solid or liquid, as metals, gunpowder, or sea-water. That used for testing the density of gunpowder consists essentially of a vessel in which the gunpowder is weighed in connection with mercury. The vessel is first partially filled with mercury by creating a vacuum; it is then emptied and a known weight of powder is placed in it, and the mercury again added under the influence of the same vacuum, less being admitted, however, in consequence of the space occupied by the powder. A comparison of the amount of mercury admitted with the weight of the powder gives the specific gravity of the powder. The *optical densimeter* of Hilgard consists of a glass prism for holding salt water, and a collimating telescope for examining a ray of light passing through the water in the prism, the refraction of the light giving the density of the water by comparison with the known angle of refraction of distilled water or sea-water of a known density. *Huch's densimeter* is used for ascertaining the density of ★syrups while boiling. See *salinometer*.

density (den′si-ti), *n.* [= F. *densité* = Sp. *densidad* = Pg. *densidade* = It. *densità*, < L. *densita(t-)s*, thickness, < *densus*, thick: see *dense*.] **1.** The quality of being dense, close, or compact; closeness of constituent parts; compactness, actual or relative.

The *density* of the ether is greater in liquids and solids than in gases, and greater in gases than in vacuo. *Tyndall*, Light and Elect., p. 62.

2. The mass or amount of matter per unit of bulk. In the c. g. s. system, density is the mass, in grams, of a cubic centimeter of the substance. Since the gram is, very closely indeed, the mass of 1 cc. of water at 4° C., the numerical quantity which expresses the density in grams per cc. gives also the density in terms of that of water. Density in terms of water as a standard is commonly called *specific gravity*. The standard of comparison for gases is sometimes hydrogen or air. The density of fluids is often determined by weighing a flask when filled with the substance,

then when filled with water, and then when empty. The density of solids is conveniently found by weighing in air and in water, which gives, by the principle of Archimedes, the weights (and consequently the masses) of equal volumes of water and of the substance. The ratio of these weights is the specific gravity or relative density. The following table shows the density of several important substances: iridium, 22.4; platinum, 21.4; gold, 19.3; mercury, 13.6; lead, 11.3; silver, 10.5; copper, 8.9; nickel, 8.7; iron, 7.8; tin, 7.3; zinc, 7.2; the earth, 5.6; diamond, 3.5; aluminium, 2.6; sulphur, 2.0; magnesium, 1.7; the human body, 1.1; india-rubber, 1.0; alcohol, 0.8; ether, 0.7; lithium, 0.6; vapor of iodide of arsenic, 1.02; air, 0.0013; aqueous vapor, 0.0008; hydrogen, 0.00009. See *specific gravity*, under *gravity*.

3. In *elect.*, the quantity of electricity per unit of volume at a point in space, or the quantity of electricity per unit of area at a point on a surface.

The electric volume-density at a given point in space is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the volume of the sphere, when its radius is diminished without limit. . . . The electric *density* at a given point on a surface is the limiting ratio of the quantity of electricity within a sphere whose centre is the given point to the area of the surface contained within the sphere, when its radius is diminished without limit.
Clerk Maxwell, Elect. and Mag., § 64.

It is expressed by the weight, in ounces, of a cubic foot of the powder.—**Magnetic density**, the rate of distribution of lines of force in a magnetic field. The unit is the gauss or one c. g. s. line per square centimeter.

The name *dental* is very imperfectly descriptive, as the teeth bear no important part in producing the sounds in question, and even, in the utterance of many communities, no part at all. Hence some phonetists avoid the term, using instead *lingual*, *tongue-point*, or the like.

The Hebrews have assigned which letters are labial, which *dental*, and which guttural. *Bacon.*

3. Connected with or used in dentistry: as, *dental* rubber; a *dental* mallet or hammer.—**Dental arch**, the curved line of the teeth in their sockets, corresponding to the alveolar border of each jaw. The somewhat parabolic curve of this arch in man, and its continuity, are among the diagnostic zoological characters of the genus *Homo*.—**Dental canal.** See *canal*[1].—**Dental cartilage.** See *cartilage*.—**Dental cavity**, the natural hollow of a tooth; the pulp-cavity (which see).—**Dental chisel, cut, drill, file, foramen**, etc. See the nouns.—**Dental formula**, a formal or tabular statement of the number and kinds of teeth a mammal may have; a formula of the dentition, in which the letters *i.*, *c.*, *pm.*, and *m.* respectively denote *incisor*, *canine*, *premolar*, and *molar*, and figures are used to indicate the number of each kind of teeth, the figures above a horizontal line (like the numerator of a fraction) referring to the upper jaw, those below the line to the lower jaw. When the letter *d* is prefixed to *i.*, *c.*, *pm.*, and *m.*, it signifies *deciduous*, and consequently the formula is that of the milk-dentition. The dental formula is usually written in full, as in the subjoined extract; but since there are always the same number of teeth on each side of either jaw, sometimes only each half jaw is indicated: thus, the formula for adult man would be: $i.\ \frac{2}{2}$, $c.\ \frac{1}{1}$, $pm.\ \frac{2}{2}$, $m.\ \frac{3}{3} \times 2 = 32$. See the extract.

The *dental formula* of a child over two years of age is thus:

$$di.\ \frac{2-2}{2-2},\ dc.\ \frac{1-1}{1-1},\ dm.\ \frac{2-2}{2-2} = 20;$$

which means that the child should have two incisors, one canine, and two molars, on each side of each jaw. . . . The formula of the permanent dentition in man is written:

$$i.\ \frac{2-2}{2-2},\ c.\ \frac{1-1}{1-1},\ pm.\ \frac{2-2}{2-2},\ m.\ \frac{3-3}{3-3} = 32;$$

there being two incisors, one canine, two premolars, and three molars on each side above and below.

Dentaliidæ (den-ta-lī'i-dē), *n. pl.* [NL., < *Dentalium* + *-idæ*.] A family of mollusks, constituting the class *Scaphopoda* (or order *Cirribranchiata* of *Gastropoda*); the tooth-shells. They are dœcious, headless, eyeless, with a trilobate foot, rudimentary lateral jaws, the mouth surrounded with filiform tentacles; the shell slender, conical, curved, open at both ends, with circular aperture and posterior attachment of the animal; the mantle saccular, open at both ends, the foot being protruded through the larger opening. The larvæ are free-swimming and ciliate, with a somewhat bivalvular shell, which subsequently becomes tubular. There are about 150 living and upward of 250 extinct species, beginning with the Devonian. The animals live buried in the mud, where they crawl slowly about. (See *Scaphopoda, tooth-shell.*) The family has been divided by recent systematists into various genera, for which the names *Dentalium*, *Antale*, and *Entalis* have been used. Also *Dentalidæ*, *Dentaliadæ*.

Dentin resembles bone, but is ordinarily denser and harder. The difference is seen on microscopic section, when a multitude of very fine closeset tubules or canaliculi (the dentinal tubes) are seen following a parallel straight or wavy course, and no corpuscles or lacunæ appear, while bone-tissue shows abundant corpuscles with the canaliculi radiating in every direction. The corpusculated parts of teeth are the softer constituents, as the cement or pulp, for example, whence the canaliculi alone penetrate the dentin, which is therefore comparable to the canalicular substance of bone in a state of extreme density and hardness. See cut under *tooth*.

The notch, nick, or tooth of the bill of the *Dentirostres* is not to be confounded with the tooth of the bill of certain birds of prey, as falcons, nor with the series of teeth of the lamellirostral birds, as ducks. In very many technically dentirostral birds there is no trace whatever of a notch or tooth.

Dentirostral Bill (Shrike).

dentirostrate (den-ti-ros'trāt), *a.* [< L. *den(t-)s*, = E. *tooth*, + *rostratus*, beaked, < *rostrum*, a beak: see *rostrum*.] Same as *dentirostral*.

In Cuvier's system of classification, the first family of his *Passerinæ*, "wherein the upper mandible is notched on each side towards the point. It is in this family that the greatest number of insectivorous birds occur, though many of them feed likewise upon berries and other soft fruits." They are contrasted with *Fissirostres*, *Conirostres*, and *Tenuirostres*. The immense assemblage of birds here indicated is definable by no common character, least of all by the one assigned by Cuvier, and the term consequently fell into disuse. It is still employed, however, in a modified sense, for a superfamily group of oscine passerine birds approximately equivalent to the turdoid *Passeres* of Wallace. See *Passeres*, *Turdiformes*.

the incisors are scalpriform, and canines are absent; the *monophyodont dentition*, in which there is but one set of teeth; the *diphyodont dentition*, in which there are two sets of teeth, etc. Many dentitions are known technically by the name of the genus or other group of animals to which they pertain, as the *diprotodont dentition*, the *polyprotodont dentition*, the *bunodont*, *bathmodont*, etc., the adjective in such cases being frequently applied to the animals themselves as well as to the number and arrangement of their teeth. See cuts under *acrodont* and *ruminant*. For formulas of dentition, see *dental formula*, under *dental*, *a.*

2. In *geol.*, the wearing away and removal by natural agencies, such as rain, rivers, frost, ice, and wind, of a part of the solid matter of the earth's surface. weighings of numerous early coins, has been found equal to 43.7 grains troy, making the value of the coin about 9 United States cents; while the latter is said to be heavier in the ratio of 10 to 9, so that it would be 48 grains. This is still approximately the mass of the derham (weight) in most localities; though in some places it sinks nearly to 46 and in others rises almost to 50 grains, and in Abyssinia is even said to be only 40 or 41 grains. There was in early times a derham of half the usual weight, and two units of this name now employed in Persia are equal to nearly 150 and 300 grains respectively. The Morocco coin, the derham, is reckoned equivalent to $7\frac{1}{2}$ United States cents.

On shipboard a derrick is a spar raised on end, with the head steadied by guys and the heel by lashings, and having one or more purchases depending from it to raise heavy weights.—**Floating derrick**, a movable derrick erected on a float, barge, or other vessel especially designed to carry it.

A single narrative may contain many descriptions of separate events.

The seventh species of imperfect definition consists of a coacervation or heaping up of circumstances and common adjuncts. S.]—**Descriptive muster-roll.** See *muster-roll.*—**Descriptive** (opposed to *metrical*) **property** or **proposition,** in *geom.*, usually defined to be a property or proposition which can be stated without introducing the idea of magnitude. But it would be better to say that it is a property or proposition which relates to the incidence or coincidence of points, lines, and other geometrical elements, in general, or that it is one which does not depend upon the particular system of measurement adopted. Thus, the proposition that two triangles are equal if a side and two angles of the one are equal to the corresponding side and angles of the other, may be regarded as descriptive; while the proposition that through any point in space a single parallel to a given line can be drawn, is indisputably metrical, not descriptive.

We have in the plane a special line, the line infinity; and on this line two special (imaginary) points, the circular points at infinity. A geometrical theorem has either no relation to the special line and points, and it is then *descriptive;* or it has a relation to them, and it is then metrical. *Salmon.*

II. *n.* A desert place or region; a waste; a wilderness; specifically, in *geog.*, a region of considerable extent which is almost if not quite destitute of vegetation, and hence uninhabited, chiefly on account of an insufficient supply of rain: as, the *desert* of Sahara; the Great American *Desert*. The presence of large quantities of movable sand sometimes adds to the desert character of a region. The word is chiefly and almost exclusively used with reference to certain regions in Arabia and northern Africa and others lying in central Asia. (See *steppe*.) The only region in North America to which the word is applied is the Great American Desert, a tract of country south and west of Great Salt Lake, once occupied by the waters of that lake when they extended over a much larger area than they now occupy. The name *Great American Desert* was originally given to the unexplored region lying beyond the Mississippi, without any special designation of its limits. Colonel Dodge, U. S. A., says in "The Plains of the Great West" (1877): "When I was a schoolboy my map of the United States showed between the Missouri River and the Rocky Mountains a long and broad white blotch, upon which was printed in small capitals 'The Great American Desert — Unexplored.' . . . What was then regarded as a desert supports, in some portions, thriving populations." In Fremont's report the Great Basin is frequently spoken of as "the Desert." It is also called the *Great Desert Basin*.

=**Syn.** *Wilderness, Desert.* Strictly, a *wilderness* is a wild, unreclaimed region, uninhabited and uncultivated, while a *desert* is largely uncultivable and uninhabitable owing to lack of moisture. A *wilderness* may be full of luxuriant vegetation. In a great majority of the places where *desert* occurs in the authorized version of the Bible, the revised version changes it to *wilderness*.

A pathless *wilderness* remains
Yet unsubdued by man's reclaiming hand.

=**Syn.** 1. *Desert, Merit, Worth.* *Desert* expresses most and *worth* least of the thought or expectation of reward. None of them suggests an actual claim. He is a man of great *worth* or excellence; intellectual *worth;* moral *worth;* the *merits* of the piece are small; he is not likely to get his *deserts*.

F. *dépêcher*, rid, discharge, hasten, expedite, despatch; cf. Sp. Pg. *despachar*, It. *dispacciare*, *spacciare*, *spicciare*, despatch, etc. If these forms had a common source, some confusion or corruption must have occurred in their development. (2) The Sp., Pg., and It. forms, if not dependent on the F., would seem to point to ML. **dispactare* or **dispactiare*, lit. unfasten, < *dis-* priv. + **pactare*, freq. of L. *pangere*, pp. *pactus*, fasten, bind: see *pact*. According to the first explanation, *despatch* is coradicate with its equiv. *expede*, *expedite*, and their opposites *impede*, *impedite*: see *impeach*, in which the second syllable is the same as the second syllable of *depeach*, an obs. var. of *despatch*. 3. In *math.*, the sum of all the products which can be formed of a square block of quantities, each product containing as a factor one number from each row and one from each column of the block, and each product being affected by the plus or minus sign according as the arrangement of rows from which its factors are

taken (these factors being arranged in the order of the columns from which they are taken) requires an even or an odd number of transpositions to reduce it to the arrangement in the square. A determinant is conventionally denoted by writing the square block of quantities between two vertical lines. For example,

$$\begin{vmatrix} A, & B \\ a, & b \end{vmatrix} = Ab - aB.$$

$$\begin{vmatrix} A, & B, & C \\ a, & b, & c \\ \alpha, & \beta, & \gamma \end{vmatrix} = Ab\gamma - A\beta c + a\beta C - abC + aBc - aB\gamma.$$

The different products of which a determinant is the sum are called its *terms*. The different quantities which are multiplied to form the terms are called the *elements of the determinant*. The oblique line of places from the upper left-hand to the lower right-hand corner is called the *principal diagonal*. The conjugate line of places is called the *secondary diagonal*. The composite determinant is usually denoted by writing its oblong matrix with two vertical lines on each side.—**Compound determinant,** a determinant whose elements are themselves determinants.—**Cubic determinant,** a quantity formed on the analogy of a determinant proper from a cube of quantities as elements.—**Cyclic determinant.** Same as *circulant*.—**Determinant of a linear transformation** or **substitution,** the determinant whose elements are the coefficients of the equations of transformation regularly arrayed.—**Functional determinant,** one in which all the elements in each row are differential coefficients of one quantity, while all the elements in each column are differential coefficients with respect to one variable.—**Gauche determinant.** Same as *skew determinant*. See below.—**Minor determinant,** or **minor of a determinant,** a determinant whose matrix is formed from the matrix of another determinant by erasing part of the rows and columns. *First minor*, a minor formed by erasing one row and one column; *second minor*, a minor formed by erasing two rows and two columns, etc.—***N*-dimensional determinant** of the rth order, a function of r^n elements, analogous to an ordinary determinant.—**Orthosymmetric determinant,** one all the elements of which, having the sum of the ordinal places of the row and column the same, are equal.—**Partial determinant.** Same as *minor determinant*.—**Persymmetric determinant,** one which is symmetrical with reference to both diagonals.—**Reciprocal determinant,** a determinant each element of which is the corresponding first minor of the determinant of which it is the reciprocal.—**Skew determinant,** one in which every element of the ith row and j^{th} column is in every case the negative of the one in the jth row and i^{th} column, except on the principal diagonal. Also called *gauche determinant*.—**Skew symmetric determinant,** a skew determinant in which all the elements of the principal diagonal vanish.—**Symmetric determinant,** one in which the element in the ith row and j^{th} column is in every case equal to that in the jth row and i^{th} column.—**Zeroaxial determinant,** one in which the elements of the principal diagonal are all zeros. [ML. *determinatio quæstionis*, the answering a question, the posting of theses to be defended.] In Oxford and other old universities: (*a*) A solemn disputation in which the respondent is a bachelor of arts, and which is preparatory to graduation as master of arts. (*b*) A disquisition or other act substituted in recent times for the old disputation. The determinations were kept in Lent, and hence often called the *Lent determinations*. Originally, in the University of Paris (the model of most of the old universities of northern Europe, and especially of Oxford and Cambridge), there was but one degree, that of master of arts, carrying with it the right to lecture regularly in the university. The purpose of the determinations was to enable the masters to judge whether the candidate was fit to be presented to the chancellor as candidate for the mastership; and since there were no examinations, there was no other regular means of ascertaining the candidate's fitness. The baccalaureate was at first called the *determinance*, and was originally not a degree, nor conferred by the university, but merely a permission to *determine* or act as chief respondent in the Lent disputations, and was conferred by the "nation." In consequence of this inseparable connection between the baccalaureate and the determinations, the latter are often considered as conditions of the former, although they follow in time.

Hence—13†. A discussion of a question according to the scholastic method, after the model of a disputation.

Sometimes used similarly of replevin for a chattel. ★

detinue (det′i-nū), *n.* [< OF. *detinu*, *detenu*, F. *détenu*, pp. of *detenir*, F. *détenir*, detain, < L. *detinere:* see *detain*.] In *law*, an old form of action, now little used, brought to recover possession of specific articles of personal property unlawfully detained.

Rev. T. Adams, Works, I. 145.

detonable (det′ō-na-bl), *a.* [< *deton(ate)* + *-able*.] Capable of detonating, or exploding on ignition.

These grades of dynamite are only rendered *detonable* by the admixture of explosive salts; and therefore the presence of these explosive salts does serve to perform a useful function. *Eissler*, Mod. High Explosives, p. 68.

detonate (det′ō-nāt), *v.*; pret. and pp. *detonated*, ppr. *detonating*. [< L. *detonatus*, pp. of *detonare* (> F. *détoner* = Sp. Pg. *detonar*), thunder, < *de-* intensive + *tonare*, thunder: see *thunder*.] **I.** *trans.* To cause to explode; specifically, to cause to explode with great suddenness and with evolution of great heat.

II. *intrans.* To explode with great suddenness and with a loud noise: as, dry mercury fulminate *detonates* with great violence.

detonating (det′ō-nā-ting), *p. a.* Exploding; igniting with a sudden report.—**Detonating bulb**, a small glass bulb cooled quickly as soon as made, and thus subjected to unequal strains of contraction. It will bear considerable handling, but if a portion of the tail is broken off the bulb will fly into pieces. Also called *Prince Rupert's drop*.—**Detonating powders**, or *fulminating powders*, certain chemical compounds which, on being exposed to heat or suddenly struck, explode with a loud report, owing to the fact that one or more of the constituent parts suddenly assume the gaseous state. The chlorid and iodide of nitrogen are very powerful detonating substances. The compounds of ammonia with silver and gold, and the fulminates of silver and mercury, detonate by slight friction, or by the agency of heat, electricity, or sulphuric acid.—**Detonating tube**, a species of eudiometer, being a stout glass tube used in chemical analysis for detonating gaseous bodies. It is generally graduated into centesimal parts, and perforated by two opposed wires for the purpose of passing an electric spark through the gases which are introduced into it, and are confined within it over mercury and water.

Detonation may be called an explosion of the first order and involves a very rapid change accompanied by a shattering effect as distinguished from an explosion of the second order, where the change of state is relatively slower and is accompanied by a propelling or pushing effect.

Sometimes this action results in the propulsion of solids, or liquids, to some distance, or in a local disruption of matters in the immediate vicinity. Where the second action is very pronounced and projection is at a minimum, the term *detonation* is applied to the action, to distinguish it from explosion. *Encyc. Brit.*, III. 363.

detonative (det′ō-nā-tiv), *a.* [< *detonate* + *-ive*.] Capable of detonating; explosive. LG. *dat di de droos slaa!* Holstein *dat ti de druuss hale!* deuce take you! The forms show some confusion, but the E. *deuce*, LG. *dūs*, etc., are prob. orig. identical with *deuce*, *dūs*, the two at cards or dice: see *deuce*[2]. As 'the deuce' was the lowest throw, the phrase, uttered in vexation, seems to have come to be accepted as an equivalent to 'the plague,' 'the mischief,' and, with a little more emphasis, to 'the devil,' with which the alliteration would readily associate it. Like other words used in colloquial imprecation, *deuce* has lost definite meaning, and has been subjected (in LG., G., and Scand.) to more or less wilful variation of form and to some mixture with other words. Cf. LG. *de duks!* equiv. to E. *the dickens!* LG. *düker*, *deuker*, *deiker*, the deuce.] The devil: used, with or without the definite article, chiefly in exclamatory or interjectional phrases, expressing surprise, impatience, or emphasis: as, *deuce* take you! go to *the deuce!* *the deuce* you did!

The great bulk of the yolk of meroblastic ova, as birds' eggs, consists of the nutritive deutoplasm or food-

yolk, as distinguished from the protoplasm or tread, which makes up into the body of the chick.

In fact, the contents of every egg consist of two parts — (1) of a viscous albuminous protoplasm; and (2) of a fatty granular matter, the *deutoplasm* or food yolk. The first is derived from the protoplasm of the original germinal cell, while the yolk is only secondarily developed with the gradual growth of the first; and not unfrequently it is derived from the secretion of special glands.

In *biol.*, to cause to go through the process of natural evolution from a previous and lower stage, or from an embryonic state to a later and more complex or perfect one.

2. In *geom.*, reducible to a plane by bending: applied to a particular species of ruled surface, otherwise called a *torse*, which is conceived as formed by an infinite succession of straight lines, each intersecting the next.—**Developable helicoid.** See *helicoid.*

II. *n.* In *geom.*, a singly infinite continuous succession of straight lines, each intersecting the next; a torse. The word *developable* is used as a noun by modern geometers, because they do not consider this locus to be properly a surface. It is rather a skew curve regarded under a particular aspect. A developable is generated by a line which turns about a point in itself, while this point moves along the line. The locus of the point is a skew curve, called the edge of regression of the developable, to which the line is constantly tangent. The developable is thus the locus of tangents of a skew curve. Considering the osculating plane at any fixed point of this curve, the moving tangent comes up to this plane so that for an instant its motion is in the plane and then passes off; and the result is that the curve is a cuspidal edge of the developable considered as a surface.—**Polar developable** of a skew curve, the surface enveloped by its normal planes. The locus of the center of curvature of the skew curve is the edge of regression, while the axis of curvature is the generator of the polar developable.

Specifically, in *photog.*, the chemical bath in which a sensitized plate or paper is, after a photographic exposure to the light, immersed to develop or bring out the latent image. Developers for the ordinary dry-plate process may be divided into two principal classes, *alkaline developers* and *ferrous-oxalate developers*, the first generally employing carbonate of soda or potash in combination with pyrogallic acid, and the second using oxalate of potash with protosulphate of iron. The results obtained are practically the same with either bath, the latent image in the film being made visible, and the chemical changes induced being *fixed*, or made permanent in the fixing bath, which follows the developing bath. Many other chemicals may be used in development, either in combination with some of those mentioned above or in independent combinations. See *photography.*

M. Balagny claims "that with this chemical he has developed plates without fog in such a light as would have been impossible . . . with other known *developers.*"

For ships which are to remain in the same magnetic latitude, this error may be corrected or compensated by placing magnets near the affected compass. Compasses are frequently elevated above the deck on tripods or masts to obviate the effects of the ship's magnetism, the direction and amount of which depends to a certain extent upon the position of the ship's head with reference to the points of the compass while building. He is frequently referred to as the Evil One, the prince of the powers of the air, the prince of darkness, Beelzebub, Belial, the tempter, the old serpent, the dragon, etc. He is represented in the New Testament as a person, the enemy of God and of holiness, and bent on the ruin of man, but possessing only limited power, subordinate to God, able to operate only in such ways as God permits, and capable of being made subservient to God's will. In this respect he differs from Ahriman, the evil principle in the dualistic system of the Persians, who was coeval and coördinate with Ormuzd, the spirit of light and goodness, and from the devil of the Gnostic and Manichean systems. The medieval conception of the devil was largely derived from pagan mythology.

4. A false god; an idol. In the New Testament *δαιμόνιον*, or *demon*, is in one instance (see extract) rendered "devil," in the sense of an object of gentile worship, an idol, a false god.]
